

Chris Henzie

containerd reviewer and security advisor · Senior Software Engineer at Google

Sunnyvale, CA | chrishenzie@gmail.com | chrishenzie.com | github.com/chrishenzie | [in/chrishenzie](https://in.chrishenzie)

Open Source

containerd

Aug 2024 – present

- The container runtime under GKE, EKS, AKS, and Docker, and a CNCF graduated project.
- Triage incoming vulnerability reports and land the fixes for those that hold up. Prepare releases and backport fixes across every supported branch.

Kubernetes

Aug 2020 – present

- SIG-Storage: authored [KEP-2485](#), the ReadWriteOncePod access mode, restricting a volume to one pod where ReadWriteOnce restricts only to one node. Alpha in 1.22 through stable in 1.29, and wrote the [kubernetes.io announcements](#).
- SIG-Node: co-author of [KEP-5474](#), writable cgroups, which lets frameworks like [Ray](#) set limits on their own worker processes without running privileged. Shipped it in GKE ahead of upstream, and upstreamed the [NRI plugin](#).

Experience

Senior Software Engineer, Google Cloud, Google – Sunnyvale, CA

Oct 2025 – present

- Kubernetes node and container runtime for GKE. Leading writable cgroups upstream and driving the [Node Resource Interface](#) toward 1.0, both for AI/ML workloads that manage their own resources.
- Established a shared maintenance model for the Google teams that depend on containerd, and co-organized the 2026 containerd Maintainer Summit.

Software Engineer, Google Cloud, Google – Sunnyvale, CA

Feb 2024 – Oct 2025

- Led GKE's migration to containerd 2.0, which removed support for the CRI v1alpha2 API, Docker Schema 1 images, and `registry.configs.tls`.
- Built the detection that pauses automatic upgrades for clusters still relying on removed features. Every cluster reaching Kubernetes 1.33 passes through it.
- Published an [eBPF tracer](#) resolving containerd socket connections back to a pod, which found most of the affected third-party workloads.
- Drove remediation across affected customers and third-party vendors, and migrated first-party services onto a shared library negotiating the CRI version, coordinating their releases against the target GKE release.

Software Engineer, YouTube, Google – San Bruno, CA

Mar 2023 – Feb 2024

- Machine learning serving infrastructure for YouTube Discovery. Rebuilt the release process for the model server and router binaries, and added per-model authorization to serving RPCs.

Software Engineer, Google Cloud, Google – Sunnyvale, CA

May 2020 – Mar 2023

- Kubernetes storage for GKE and Anthos Multi-Cloud. Maintained the upstream [CSI sidecars](#) (provisioner, attacher, snapshotter, resizer) and the AWS EBS and EFS drivers, and brought up storage for Google Distributed Cloud air-gapped.

Software Engineer, Meta – San Francisco Bay Area

Apr 2018 – May 2020

- Twine, Meta's cluster manager and container platform. Built the log reader, a C++ service that became the sole path for fleet-wide container log queries, replacing an implementation that decompressed archives on disk and caused IO spikes.

DevOps Engineer, Twitch – San Francisco, CA

Jan 2016 – Apr 2018

- Moved developer tooling for the live video CDN off bare metal onto AWS, cutting new application stack provisioning to under four minutes with a Terraform-based deployment utility for ECS.

Software Engineer, then DevOps Engineer, Sunrun – San Francisco, CA

May 2013 – Dec 2015

- Automated provisioning and deployment for the solar design platform.

Skills

Languages: Go, Python, Bash, C++

Systems: Kubernetes, CRI, containerd, runc, OCI runtime spec, Linux containers (cgroups, namespaces)

Education

University of California, Berkeley, BS in Electrical Engineering and Computer Science – Berkeley, CA

Aug 2009 – Aug 2013
