

Chris Henzie

containerd reviewer and security advisor · Senior Software Engineer at Google

Sunnyvale, CA | chrishenzie@gmail.com | chrishenzie.com | github.com/chrishenzie | [in/chrishenzie](https://in.chrishenzie)

Open Source

containerd Aug 2024 – present

- Reviewer and security advisor. CNCF graduated project, and the container runtime under GKE, EKS, AKS, and Docker.
- Triage incoming vulnerability reports and land the fixes for those that hold up.

Kubernetes Aug 2020 – present

- Authored KEP-2485, the ReadWriteOncePod volume access mode, which restricts a PersistentVolume to a single pod. Stable in Kubernetes 1.29.
- Co-author of KEP-5474, writable cgroups, after building the implementation in GKE.

Experience

Senior Software Engineer, Google Cloud, Google – Sunnyvale, CA Oct 2025 – present

- Kubernetes node and container runtime for GKE, with most of the work going upstream into containerd and Kubernetes.

Software Engineer, Google Cloud, Google – Sunnyvale, CA Feb 2024 – Oct 2025

- Led GKE's migration to containerd 2.0, which removed the CRI v1alpha2 API, Docker Schema 1 images, and `registry.configs.tls`.
- Built the detection that pauses automatic upgrades for clusters still relying on removed features. Every cluster reaching Kubernetes 1.33 passes through it.
- Drove remediation across affected customers, third-party vendors whose agents called the removed API, and first-party services on the same path.

Software Engineer, YouTube, Google – San Bruno, CA Mar 2023 – Feb 2024

- Machine learning serving infrastructure for YouTube Discovery, a platform absorbing a high rate of newly released experimental models.
- Rebuilt the release process for the model server and router binaries, added per-model authorization to serving RPCs, and ran runtime migration experiments across recommendation model families.

Software Engineer, Google Cloud, Google – Sunnyvale, CA May 2020 – Mar 2023

- Kubernetes storage, and Google Distributed Cloud air-gapped.

Software Engineer, Meta – San Francisco Bay Area Apr 2018 – May 2020

- Twine, Meta's cluster manager and container platform. Built the log reader, a C++ service that took over 100% of fleet-wide container log queries with no production incidents, replacing an implementation that decompressed archives on disk and caused IO spikes.
- Implemented write APIs on the Twine Front End, including a job resize API handling over 96% of capacity-management resizes.

DevOps Engineer, Twitch – San Francisco, CA Jan 2016 – Apr 2018

- Moved developer tooling for the live video CDN off bare metal onto AWS, cutting new application stack provisioning to under four minutes with a Terraform-based deployment utility for ECS. Built power management for the bare-metal host fleet, enabling automated remediation.

DevOps Engineer, then Software Engineer, Sunrun – San Francisco, CA May 2013 – Dec 2015

- Automated provisioning and deployment for the solar design platform. Cut project build times by up to 80% distributing Jenkins tasks across build instances, and built a customer-facing status dashboard that reduced monthly trouble tickets by 20%.

Skills

Languages: Go, Python, Bash, C++

Systems: Kubernetes, containerd, Linux containers (cgroups, namespaces), cloud infrastructure, infrastructure as code

Education

University of California, Berkeley, BS in Electrical Engineering and Computer Science – Berkeley, CA Aug 2009 – Aug 2013
